

The Secure-Fencing, Perimeter Protection System is designed to protect long perimeters of fence from illegal entry.

This is simply done by installing the system on existing fences and gates, at relatively low cost.

Secure-Fencing is special because:

- There is full time 12 volts detection by zone on complete fence,
- When required, turn on the 5.5kv volts deterrent for extra protection,
- No need to strengthen existing fence,
- No need to periodically tighten wires, our patented springs keep them always tight,
- No need to clean system, we have installations at salt waterports for over 8 years to prove it!
- No false alarms due to plants growing in the fence, animals touching it or weather conditions.

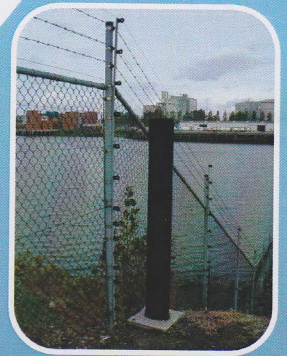

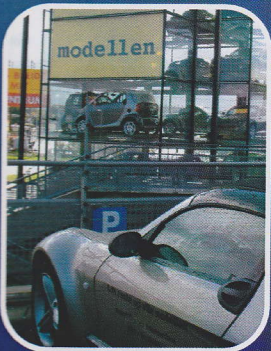

No False Alarms

Very Low Maintenance

Install on Existing Fencing

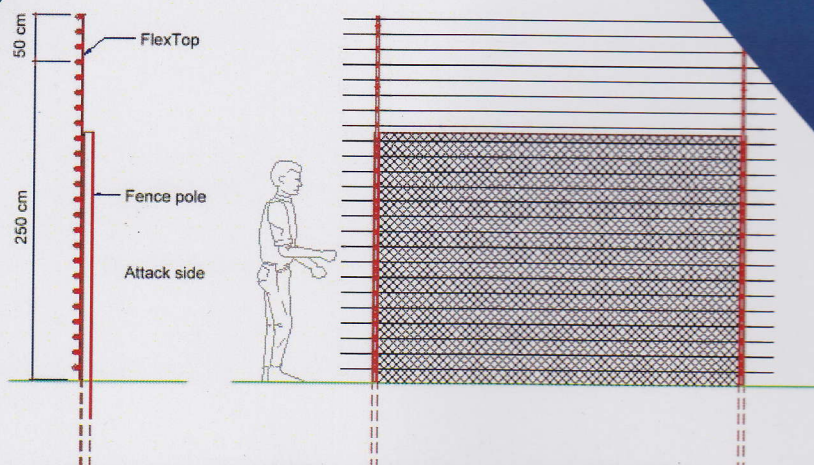

Full Perimeter Security System with 5500 volt Shock Wire Deterrent

Over a 2000 Satisfied Customers

The Price will Surprise You!

- Full Detection by Zones
- 12 volts Full Operation Too
- Connect to Any Type of Fence
- Low Power Consumption
- Very low Maintenance
- Safe for Animals & Humans
- Low & High voltage Switching (Low & High security mode)

Install on Any Fence

Special galvanized steel frames are attached to any installed fence. Frames will not rust or oxidize. No need to modify or strengthen the original fence. We can even install on walls or roofs.

NO NEED TO REPLACE FENCE!

Install on Any Gate

Any gate can be secured over its full length and height. Special programmable connectors allow the gates to generate an alarm in different situations. A gate can always generate an alarm when opened or; Only when the high voltage is on or; Never.

Integration with CCTV

The alarm signal can be fed into the security control system to activate CCTV. Alternatively, CCTV can be activated directly by the generated alarm. The combination of Secure-Fencing and CCTV creates a very secure perimeter.

International Airports

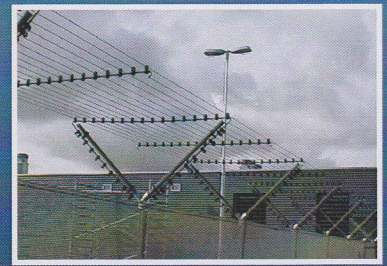

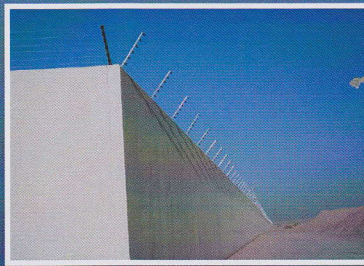

Many airports have no perimeter security at all. Although the gate entrances have very strict access control, the rest of the perimeter can be easily penetrated without detection. With Secure-Fencing it is now cost effective to secure the complete airport perimeter.

Prisons, High Security

Secure-Fencing has been extensively used to secure prisons and other high security installations. Since the low voltage detection is always on, even when the high voltage is turned off, one always has penetration detection on the fence. The 5500v shockwire adds another layer of security and detection.

Sea Ports, Harbors

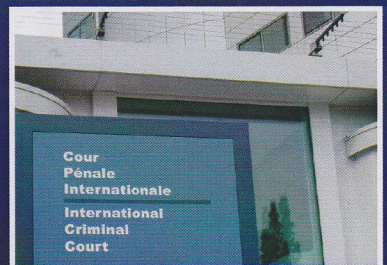

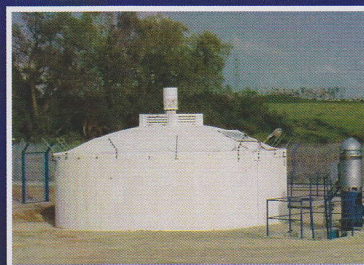

Various European ports have been secured with Secure-Fencing. The salt water, wind and sandy environments have no effect on the system as special aluminum/zinc coated steel wires and galvanized frames ensure no corrosion or oxidation occur. No cleaning is needed!

Utilities, Special

Water pumping stations, electricity transformers and other utilities are perfectly protected with low maintenance. Special high profile locations such as supreme courts, broadcasting stations, embassies and VIP residential complexes are secured in a non-aggressive and eye pleasing manner.
